Registration processor

Team :

Simhadri Surada

Vivek Kumar Mahto

Yamuna Sri Pavani Uriti

Vinash Atti

Charan Jagadeesh Varadhi

Problem statement :

During college fests or tech events, manual registration via paper or Google Sheets becomes messy with many participants, leading to errors, duplicates, and poor data management.

major issues :

→Improper segregation

→No verified registration

→No Portability in creating registration portals

→ No proper UI

Our solution :

We developed a webapplication with key features :

→Proper segregation

We added segregation based on the Gmail addresses and Mobile Numbers for each registration.

→Verified registration

Every verified user will have authentication on their Gmail and mobile number

→No Portability in creating registration portals

We added different access for registrations and event organisers .

→Verified registration

We added a unique password sections for both organisers and participants.

Tech stack :

python → For backend we used flask

HTML && CSS → For frontend

- File manipulations for storing the data

Thank you
any queries..?
